SUMMARY

Flutter developer with hands-on experience in full-stack application development using FastAPI and GraphQL, interested in building scalable products, backend systems, and developer-focused tools.

SKILLS

Languages: Dart, Python, Java, C/C++, Kotlin
Frameworks: Flutter, BLoC, FastAPI, GraphQL
Backend: REST APIs, Pydantic, OAuth2, JWT
Databases: PostgreSQL, Firebase Firestore
Tools: Git, GitHub, Postman, VS Code, Android Studio

PROJECTS

LeetCode Stats App

[Try Here](#)

- Built a cross-platform Flutter application to visualize LeetCode statistics including activity heatmaps, contest ratings, and submission streaks.
- Implemented state management using BLoC, ensuring predictable data flow and scalable architecture and integrated data and image caching to reduce API calls and improve app performance and responsiveness.
- Developed a native Android home screen widget to display real-time coding activity and streak insights. Rewrote the Dart-based LeetCode API logic in Kotlin to enable integration with a native Android home screen heatmap widget.
- Designed robust error handling mechanisms for API failures, null responses, and edge cases and made a custom FastAPI backend to fetch and process LeetCode data via GraphQL queries, optimizing data aggregation and response structure. Reduced API calls by approximately 40%.
- Implemented system-adaptive theming (light/dark mode) for improved user experience.

My Notes App

[Try Here](#)

- Developed a feature-rich note-taking application using Flutter with a clean UI, and implemented full CRUD operations with local persistence using SQLite, later migrated to Firebase Firestore for real-time cloud sync.
- Integrated authentication and authorization using Firebase Auth (email/password), and applied BLoC state management for scalable and maintainable application architecture.
- Enabled real-time sync of 100+ notes using Firebase Firestore.

REST API Project (FastAPI)

[Try Here](#)

- Built a production-style REST API using FastAPI with modular and scalable architecture and also implemented JWT-based authentication, OAuth2 flow, and secure token validation mechanisms.
- Integrated password hashing using industry-standard practices for secure credential storage and configured CORS middleware and environment-based configurations using environment variables.
- Designed relational database schema using PostgreSQL with SQLAlchemy ORM, Managed database migrations using Alembic.
- Configured CI/CD pipelines using YAML workflows for automated testing and deployment, and integrated psycopg2 for efficient PostgreSQL connectivity and performance.

GraphQL Mini Project

[Try Here](#)

- Designed and structured a GraphQL schema with well-defined types and relational mappings
- Developed efficient queries and mutations for data retrieval and manipulation, using reusable input types for scalability
- Implemented complete CRUD operations through GraphQL resolvers
- Handled relational data with nested queries, enabling flexible and optimized data access

EDUCATION

B.Tech in Computer Science and Engineering (AI & ML)

May 2028

Parul University (PIET)

CGPA: 7.35 (current)
